Since its inception, the Tutorial Guides in Electronic Engineering series has met with great success among both instructors and students. Designed for first and second year undergraduate courses, each text provides a concise list of objectives at the beginning of Page 15/19

every chapter, key definitions and formulas highlighted in margin notes, and references to other texts in the series. Electronic Components and Technology begins with an introduction to electronic interconnection technology, followed by a concise study of integrated circuits, their fabrication, packaging, and handling. The next two chapters look at various components, including power supplies, resistors, capacitors, and inductors. The author devotes considerable attention to parasitic electrical effects, including the non-ideal properties of passive components, heat and its management, and parasitic electromagnetic effects. He also emphasizes good engineering practice in relation to reliability and maintainability--two important aspects of design often overlooked by circuit designers--and includes a chapter on safety. This volume not only builds a solid foundation in properties, behavior, and use of

electronic components, but also opens students' eyes to the practical problems encountered in electronics engineering practice.

This report documents and presents the results of a study to determine the feasibility of applying Artificial Intelligence (AI) techniques to the diagnosis of transit railcars. The AI techniques investigated were expert systems, case-based reasoning, model-based reasoning, artificial neural networks, computer vision, fuzzy Page 17/19

logic, and a procedural knowledge-based system. Site surveys were conducted at transit railcar maintenance facilities and at railcar subsystem suppliers. The site surveys gathered information about current and future diagnostic and maintenance practices, possible barriers to implementing advanced AI technology, and maintenance cost data. An economic analysis was performed to provide an estimate of cost savings expected by reducing the diagnostic effort.
